

第 5 章 定积分

一、利用定积分求极限

例1 求 $\lim_{n \rightarrow \infty} \ln \frac{\sqrt[n]{n!}}{n}$

解

$$\begin{aligned}\lim_{n \rightarrow \infty} \ln \frac{\sqrt[n]{n!}}{n} &= \lim_{n \rightarrow \infty} \left(\frac{1}{n} \ln n! - \ln n \right) \\&= \lim_{n \rightarrow \infty} \frac{1}{n} (\ln 1 + \ln 2 + \cdots + \ln n - n \ln n) \\&= \lim_{n \rightarrow \infty} \frac{1}{n} [(\ln 1 - \ln n) + (\ln 2 - \ln n) + \cdots + (\ln n - \ln n)] \\&= \lim_{n \rightarrow \infty} \frac{1}{n} \left(\ln \frac{1}{n} + \ln \frac{2}{n} + \cdots + \ln \frac{n}{n} \right) \\&= \int_0^1 \ln x dx = x \ln x \Big|_0^1 - \int_0^1 dx = -1\end{aligned}$$

例2 设函数 $f(x)$ 在区间 $[0,1]$ 上连续, 且取正值.

$$\text{试证 } \lim_{n \rightarrow \infty} \sqrt[n]{f\left(\frac{1}{n}\right) \cdot f\left(\frac{2}{n}\right) \cdots f\left(\frac{n}{n}\right)} = e^{\int_0^1 \ln f(x) dx}.$$

证明 利用对数的性质得

$$\begin{aligned} & \lim_{n \rightarrow \infty} \sqrt[n]{f\left(\frac{1}{n}\right) \cdot f\left(\frac{2}{n}\right) \cdots f\left(\frac{n}{n}\right)} \\ &= e^{\ln \left(\lim_{n \rightarrow \infty} \sqrt[n]{f\left(\frac{1}{n}\right) \cdot f\left(\frac{2}{n}\right) \cdots f\left(\frac{n}{n}\right)} \right)} \\ &= e^{\lim_{n \rightarrow \infty} \left(\ln \sqrt[n]{f\left(\frac{1}{n}\right) \cdot f\left(\frac{2}{n}\right) \cdots f\left(\frac{n}{n}\right)} \right)} \end{aligned}$$

$$\begin{aligned} &= e^{\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n \ln f\left(\frac{i}{n}\right)} \\ &= e^{\lim_{n \rightarrow \infty} \sum_{i=1}^n \ln f\left(\frac{i}{n}\right) \cdot \frac{1}{n}} \\ &\quad \downarrow \begin{array}{l} \because f(x) \in C[0,1], \\ f(x) > 0 \end{array} \\ &= e^{\int_0^1 \ln f(x) dx}. \end{aligned}$$

例3 求 $\lim_{n \rightarrow \infty} \left(\frac{2^{\frac{1}{n}}}{n+1} + \frac{2^{\frac{2}{n}}}{n+\frac{1}{2}} + \cdots + \frac{2^{\frac{n}{n}}}{n+\frac{1}{n}} \right) \cdot \left(\frac{1}{\ln 2} \right)$

解 提示：先用夹逼准则

$$\frac{2^{\frac{1}{n}} + 2^{\frac{2}{n}} + \cdots + 2^{\frac{n}{n}}}{n+1} \leq \left(\frac{2^{\frac{1}{n}}}{n+1} + \frac{2^{\frac{2}{n}}}{n+\frac{1}{2}} + \cdots + \frac{2^{\frac{n}{n}}}{n+\frac{1}{n}} \right) \leq \frac{2^{\frac{1}{n}} + 2^{\frac{2}{n}} + \cdots + 2^{\frac{n}{n}}}{n+\frac{1}{n}}$$

$$\text{左边} = \lim_{n \rightarrow \infty} \frac{2^{\frac{1}{n}} + 2^{\frac{2}{n}} + \cdots + 2^{\frac{n}{n}}}{n+1} = \lim_{n \rightarrow \infty} \frac{2^{\frac{1}{n}} + 2^{\frac{2}{n}} + \cdots + 2^{\frac{n}{n}}}{n} \cdot \frac{1}{1+\frac{1}{n}}$$

$$= \int_0^1 2^x dx = \frac{2^x}{\ln 2} \Big|_0^1 = \frac{1}{\ln 2}$$

例4 求: (1) $\lim_{n \rightarrow \infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \cdots + \frac{1}{2n} \right)$

(2) $\lim_{x \rightarrow +0} \frac{\int_0^{\sin x} \sqrt{\tan x} dx}{\int_0^{\tan x} \sqrt{\sin x} dx}$

解(1) 原式 $= \lim_{n \rightarrow \infty} \frac{1}{n} \left(\frac{1}{1 + \frac{1}{n}} + \frac{1}{1 + \frac{2}{n}} + \cdots + \frac{1}{1 + \frac{n}{n}} \right)$

$$= \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n \frac{1}{1 + \frac{i}{n}} = \int_0^1 \frac{1}{1+x} dx = \ln 2$$

例4 求: (1) $\lim_{n \rightarrow \infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \cdots + \frac{1}{2n} \right)$

(2) $\lim_{x \rightarrow +0} \frac{\int_0^{\sin x} \sqrt{\tan x} dx}{\int_0^{\tan x} \sqrt{\sin x} dx}$

解(2) 原式 $\overset{\frac{0}{0}}{=} \lim_{x \rightarrow +0} \frac{\sqrt{\tan x \sin x} \cos x}{\sqrt{\sin x \tan x} \sec^2 x} = \lim_{x \rightarrow +0} \frac{\sqrt{\tan x \sin x}}{\sqrt{\sin x \tan x}}$

等价无穷
小代换

$\rightarrow = \sqrt{\lim_{x \rightarrow +0} \frac{\sin x}{\tan x}} = 1$

二、含有变上限积分的有关题目

$$1. \lim_{x \rightarrow \infty} \frac{e^{-x^2} \int_0^x t^2 e^{t^2} dt}{x} \quad \left(\frac{1}{2} \right)$$

$$2. \text{ 求常数 } a, b \text{ 使 } \lim_{x \rightarrow 0} \frac{\int_0^x (at - \arcsin t) dt}{b - \cos x} = 1$$
$$(a = 2, b = 1)$$

3. 设 $f(x) = \frac{1}{2} \int_0^x (x-t)^2 g(t) dt$, $g(t)$ 连续,
求 $f'(x)$, $f''(x)$.

$$(f'(x) = \int_0^x (x-t)g(t)dt, f''(x) = \int_0^x g(t)dt)$$

4. 设 $f(x) = \int_0^x [\int_1^{\sin t} \sqrt{1+u^4} du] dt$, 求 $f''(x)$.

$$(f''(x) = \cos x \sqrt{1 + \sin^4 x})$$

5. 设 $F(x) = \int_0^x e^{-t^2} dt$, 证明 $F(x)$ 是单调递增的.
其图形过原点, 且原点是其图形的一个拐点.

$$6. \text{ 研究 } f(x) = \begin{cases} \frac{(1 - \cos x)}{x} & x < 0 \\ 0 & x = 0 \\ \frac{\int_0^{x^2} \cos t^2 dt}{x} & x > 0 \end{cases}$$

在点 $x = 0$ 的连续性和可导性.

(在 $x = 0$ 处函数连续, 但不可导)

7. 设 $f(x)$ 是 $[a, +\infty)$ 上的连续单调增加函数,

$$\text{求证: } F(x) = \frac{1}{x-a} \int_a^x f(t) dt$$

在 $[a, +\infty)$ 上也是单调增加函数.

8. 设 $\Phi(x) = \int_a^x f(t)dt + \int_b^x \frac{dt}{f(t)}$, 其中 $f(t)$ 在 $[a, b]$ 上连续, 且 $f(t) > 0$, 试证明方程 $\Phi(x) = 0$ 在 $[a, b]$ 内必有且仅有一个实数根.

9. 求函数 $f(x) = \int_0^x \frac{3t+1}{t^2-t+1} dt$ 在区间 $[0, 1]$ 上的最大值与最小值 .

$$(m = f(0) = 0; \quad M = f(1) = \frac{5\pi}{3\sqrt{3}})$$

10. 已知
$$\begin{cases} x = \cos(t^2) \\ y = t \cos(t^2) - \int_1^{t^2} \frac{1}{2\sqrt{u}} \cos u du \end{cases},$$

求 $\frac{d^2 y}{dx^2}$ 在 $t = \sqrt{\frac{\pi}{2}}$ 的值。 $(-\frac{1}{\sqrt{2\pi}})$

11. 求由 $\int_0^y e^{t^2} dt + \int_0^{x^2} \sin t dt = 0$ 确定的隐函数 $y = y(x)$ 对 x 的导数.

$(y' = \frac{-2x \sin x^2}{e^{y^2}}).$

12 设 $f(x)$ 在 $[0,1]$ 上连续, 且 $f(x) < 1$. 证明

$2x - \int_0^x f(t)dt = 1$ 在 $[0,1]$ 上只有一个解.

13 设 $f(x) \in C[a,b]$, $f(x)$ 在 $[a,b]$ 内可导, 且 $f(a) = 0$,

$f(b) = \int_b^a f(t)dt$, 求证 $\exists \xi \in (a,b)$ 使 $f'(\xi) = -f(\xi)$.

解

$$1 \quad \lim_{x \rightarrow \infty} \frac{e^{-x^2} \int_0^x t^2 e^{t^2} dt}{x}$$

$$= \lim_{x \rightarrow \infty} \frac{\int_0^x t^2 e^{t^2} dt}{x e^{x^2}} \quad \boxed{\frac{\infty}{\infty}}$$

$$= \lim_{x \rightarrow \infty} \frac{x^2 e^{x^2}}{e^{x^2} + x e^{x^2} 2x}$$

$$= \lim_{x \rightarrow \infty} \frac{x^2}{1 + 2x^2} = \frac{1}{2}$$

2. 求常数 a, b 使 $\lim_{x \rightarrow 0} \frac{\int_0^x (at - \arcsin t) dt}{b - \cos x} = 1$

解 $\because \lim_{x \rightarrow 0} \frac{\int_0^x (at - \arcsin t) dt}{b - \cos x} = 1$

$$\lim_{x \rightarrow 0} \int_0^x (at - \arcsin t) dt = 0 \quad \therefore \lim_{x \rightarrow 0} (b - \cos x) = 0$$

从而有 $b = 1$.

又
$$\lim_{x \rightarrow 0} \frac{\int_0^x (at - \arcsin t) dt}{1 - \cos x} = \lim_{x \rightarrow 0} \frac{\int_0^x (at - \arcsin t) dt}{\frac{1}{2}x^2}$$

$$= \lim_{x \rightarrow 0} \frac{ax - \arcsin x}{x} = a - 1 \quad \therefore a = 2$$

3. 设 $f(x) = \frac{1}{2} \int_0^x (x-t)^2 g(t) dt$, $g(t)$ 连续,
求 $f'(x)$, $f''(x)$.

$$(f'(x) = \int_0^x (x-t)g(t)dt, f''(x) = \int_0^x g(t)dt)$$

4. 设 $f(x) = \int_0^x [\int_1^{\sin t} \sqrt{1+u^4} du] dt$, 求 $f''(x)$.

$$(f''(x) = \cos x \sqrt{1 + \sin^4 x})$$

5. 设 $F(x) = \int_0^x e^{-t^2} dt$, 证明 $F(x)$ 是单调递增的.
其图形过原点, 且原点是其图形的一个拐点.

证明 $F'(x) = e^{-x^2} > 0,$

$\therefore F(x)$ 在 $(-\infty, +\infty)$ 上 $\uparrow$.

又 $F''(x) = e^{-x^2} \overset{\text{令}}{(-2x)} = 0 \therefore x = 0$

当 $x \in (-\infty, 0)$ 时, $F''(x) > 0, F(x)'' \cup ''$

当 $x \in (0, +\infty)$ 时, $F''(x) < 0, F(x)'' \cap ''$

$\therefore F(0) = 0, \therefore (0, 0)$ 是拐点。

6. 研究 $f(x) = \begin{cases} \frac{(1 - \cos x)}{x} & x < 0 \\ 0 & x = 0 \\ \frac{\int_0^{x^2} \cos t^2 dt}{x} & x > 0 \end{cases}$ 在点 $x = 0$ 处的连续性和可导性.

解 $\because \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^+} \frac{\int_0^{x^2} \cos t^2 dt}{x} = \lim_{x \rightarrow 0^+} \frac{2x \cos x^4}{1} = 0$

$$\lim_{x \rightarrow 0^-} f(x) = \lim_{x \rightarrow 0^-} \frac{(1 - \cos x)}{x} = \lim_{x \rightarrow 0^-} \frac{\sin x}{1} = 0$$

$$\therefore \lim_{x \rightarrow 0^+} f(x) = \lim_{x \rightarrow 0^-} f(x) = f(0)$$

$$\begin{aligned}
 \because f_+(0) &= \lim_{x \rightarrow 0^+} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^+} \frac{f(x)}{x} \\
 &= \lim_{x \rightarrow 0^+} \frac{\int_0^{x^2} \cos t^2 dt}{x^2} = \lim_{x \rightarrow 0^+} \frac{2x \cos x^4}{2x} = 1
 \end{aligned}$$

$$\begin{aligned}
 f_-(0) &= \lim_{x \rightarrow 0^-} \frac{f(x) - f(0)}{x - 0} = \lim_{x \rightarrow 0^-} \frac{f(x)}{x} \\
 &= \lim_{x \rightarrow 0^-} \frac{(1 - \cos x)}{x^2} = \lim_{x \rightarrow 0^-} \frac{\sin x}{2x} = \frac{1}{2}
 \end{aligned}$$

$f_+(0) \neq f_-(0), \quad \therefore f'(0)$ 不存在.

$$\text{又} \because f'(x) = \begin{cases} \frac{x \sin x - (1 - \cos x)}{x^2} & x < 0 \\ \frac{2x^3 \cos x^4 - \int_0^{x^2} \cos t^2 dt}{x^2} & x > 0 \end{cases}$$

$$\lim_{x \rightarrow +0} f'(x) = \lim_{x \rightarrow -0} \frac{x \sin x - (1 - \cos x)}{x^2} = \lim_{x \rightarrow -0} \frac{x \cos x}{2x} = \frac{1}{2}$$

$$\lim_{x \rightarrow -0} f'(x) = \lim_{x \rightarrow +0} \frac{2x^3 \cos x^4 - \int_0^{x^2} \cos t^2 dt}{x^2}$$

$$= \lim_{x \rightarrow +0} \frac{2x^3 \cos x^4}{x^2} - \lim_{x \rightarrow +0} \frac{\int_0^{x^2} \cos t^2 dt}{x^2}$$

$$= 0 - \lim_{x \rightarrow +0} \frac{2x \cos x^4}{2x} = 1$$

$$f'(+0) \neq f'(-0)$$

$\therefore f(x)$ 在点 $x = 0$
连续, 但不可导。

7. 设 $f(x)$ 是 $[a, +\infty)$ 上的连续单调增加函数,

求证:
$$F(x) = \frac{1}{x-a} \int_a^x f(t) dt$$

在 $[a, +\infty)$ 上也是单调增加函数.

证明 $F(x)$ 在 $(a, +\infty)$ 内连续, 而在 $x = a$ 处

$$\lim_{x \rightarrow a^+} F(x) = \lim_{x \rightarrow a^+} \frac{\int_a^x f(t) dt}{x - a} = f(a)$$

令 $F(a) = f(a)$, 则 $F(x)$ 在 $[a, +\infty)$ 上连续.

$$\begin{aligned} F'(x) &= \frac{(x-a)[\int_a^x f(t)]' - \int_a^x f(t) dt \cdot (x-a)'}{(x-a)^2} \\ &= \frac{(x-a)f(x) - \int_a^x f(t) dt}{(x-a)^2} = \frac{(x-a)f(x) - f(\xi)(x-a)}{(x-a)^2} \\ &= \frac{f(x) - f(\xi)}{x-a} \quad \because a \leq \xi \leq x, f(x) \text{单调增加} \end{aligned}$$

$x-a > 0$, $\therefore F'(x) > 0$; 故 $F(x)$ 在 $[a, +\infty)$ 上单调增加.

8. 设 $\Phi(x) = \int_a^x f(t)dt + \int_b^x \frac{dt}{f(t)}$, 其中 $f(t)$ 在 $[a, b]$ 上连续, 且 $f(t) > 0$, 试证明方程 $\Phi(x) = 0$ 在 $[a, b]$ 内必有且仅有一个实数根.

证明
$$\Phi'(x) = f(x) + \frac{1}{f(x)} \geq 2\sqrt{f(x) \cdot \frac{1}{f(x)}} = 2$$

$$\Phi(a) = \int_a^a f(t)dt + \int_b^a \frac{dt}{f(t)} = \int_b^a \frac{dt}{f(t)}$$

$$\Phi(b) = \int_a^b f(t)dt + \int_b^b \frac{dt}{f(t)} = \int_a^b f(t)dt$$

$$\Phi(a) \cdot \Phi(b) < 0$$

9. 求函数 $f(x) = \int_0^x \frac{3t+1}{t^2-t+1} dt$ 在区间 $[0, 1]$ 上的最大值与最小值 .

$$(m = f(0) = 0; \quad M = f(1) = \frac{5\pi}{3\sqrt{3}})$$

10. 已知
$$\begin{cases} x = \cos(t^2) \\ y = t \cos(t^2) - \int_1^{t^2} \frac{1}{2\sqrt{u}} \cos u du \end{cases}, \quad \boxed{-\frac{1}{\sqrt{2\pi}}}$$

求 $\frac{d^2 y}{dx^2}$ 在 $t = \sqrt{\frac{\pi}{2}}$ 的值。

解

$$\frac{dy}{dx} = \frac{\cos(t^2) - 2t^2 \sin(t^2) - \frac{\cos(t^2)}{2t} 2t}{-2t \sin(t^2)} = t$$

$$\frac{d^2 y}{dx^2} = \frac{d}{dt} \frac{dy}{dx} \frac{dt}{dx} = \frac{dt}{-2t \sin(t^2) dt} = -\frac{1}{2t \sin(t^2)}.$$

$$\therefore \left. \frac{d^2 y}{dx^2} \right|_{t=\sqrt{\frac{\pi}{2}}} = -\frac{1}{2\sqrt{\frac{\pi}{2}} \sin \frac{\pi}{2}} = -\frac{1}{\sqrt{2\pi}}.$$

11. 求由 $\int_0^y e^{t^2} dt + \int_0^{x^2} \sin t dt = 0$ 确定的隐函数 $y = y(x)$ 对 x 的导数.

解 $(\int_0^y e^{t^2} dt)' + (\int_0^{x^2} \sin t dt)' = 0$

则 $e^{y^2} y' + \sin x^2 2x = 0$

$$\therefore y' = \frac{-2x \sin x^2}{e^{y^2}}.$$

12. 设 $f(x)$ 在 $[0,1]$ 上连续, 且 $f(x) < 1$. 证明

$2x - \int_0^x f(t)dt = 1$ 在 $[0,1]$ 上只有一个解.

证 令 $F(x) = 2x - \int_0^x f(t)dt - 1$,

$$\because f(x) < 1, \quad \therefore F'(x) = 2 - f(x) > 0,$$

$F(x)$ 在 $[0,1]$ 上为单调增加函数. $F(0) = -1 < 0$,

$$F(1) = 1 - \int_0^1 f(t)dt = \int_0^1 [1 - f(t)]dt > 0,$$

所以 $F(x) = 0$ 即原方程在 $[0,1]$ 上只有一个解.

13. 设 $f(x) \in C[a, b]$, $f(x)$ 在 $[a, b]$ 内可导, 且 $f(a) = 0$,
 $f(b) = \int_b^a f(t)dt$, 求证 $\exists \xi \in (a, b)$ 使 $f'(\xi) = -f(\xi)$

解 构造辅助函数

$$F(x) = f(x) + \int_a^x f(t)dt$$

14. 设 $f(x) \in C[a, b]$, 在 (a, b) 内可导, 且 $f'(x) \leq 0$

证明 : $F(x) = \frac{\int_a^x f(t)dt}{x-a}$ 在 (a, b) 内也有 $F'(x) \leq 0$

证明
$$F'(x) = \frac{f(x)(x-a) - \int_a^x f(t)dt}{(x-a)^2}$$
$$= \frac{f(x)(x-a) - f(\xi)(x-a)}{(x-a)^2} = \frac{f(x) - f(\xi)}{x-a} \leq 0$$

(令 $g(x) = f(x)(x-a) - \int_a^x f(t)dt$

$$g'(x) = f(x) + f'(x)(x-a) - f(x) \leq 0$$

$$\because g(a) = 0 \quad g'(x) \leq 0 \quad \therefore g(x) \leq 0 \quad i.e. F'(x) \leq 0)$$

15. 设 $f(x)$ 在闭区间 $[0,1]$ 上可导,且满足

$$f(1) - 2 \int_0^{\frac{1}{2}} xf(x)dx = 0$$

求证在 $(0,1)$ 内至少存在一点 η 使 $\eta f'(\eta) = -f(\eta)$

证明 构造函数 $F(x) = xf(x)$

$$\because F(1) = f(1), \text{ 又 } \because f(1) - 2 \int_0^{\frac{1}{2}} xf(x)dx = 0$$

$\therefore$ 由积分中值定理得, $\exists \xi \in [0, \frac{1}{2}]$ 使 $f(1) - \xi f(\xi) = 0$,

$$\text{即 } f(1) = \xi f(\xi) = F(\xi) = F(1)$$

$\therefore$ 由微分中值定理得 $\exists \eta \in (\xi, 1) \subset (0, 1)$

使 $F'(\eta) = 0$, 即 $\eta f'(\eta) = -f(\eta)$.

三、与换元有关的题目

1. 设 $f(x)$ 可导,且 $f(0) = 0$,

$$F(x) = \int_0^x t^{n-1} f(x^n - t^n) dt$$

求证： $\lim_{x \rightarrow 0} \frac{F(x)}{x^{2n}} = \frac{1}{2n} f'(0)$

2. 设 $f(x)$ 连续且常数 $a > 0$,证明：

$$\int_1^a f\left(x^2 + \frac{a^2}{x^2}\right) \frac{dx}{x} = \int_1^a f\left(x + \frac{a^2}{x}\right) \frac{dx}{x}$$

3. 设 $f(x)$ 为连续函数, 证明

$$\int_0^x f(t)(x-t)dt = \int_0^x \left(\int_0^t f(u)du \right) dt$$

4 设 $f(x)$ 是连续函数求证:

$$\int_0^{2a} f(x)dx = \int_0^a (f(x) + f(2a-x))dx$$

并计算 $\int_0^{\pi} \frac{x \sin x}{1 + \sin^2 x} dx$ ($= \frac{\pi}{2\sqrt{2}} \ln \frac{\sqrt{2}+1}{\sqrt{2}-1}$)

5 证明: 设 $f(x)$ 为连续函数, 且当 $0 \leq x \leq \frac{a}{2}$ 时,

$$f(x) + f(a-x) > 0 \quad \text{试证: } \int_0^a f(x)dx > 0$$

6 设 $f(x)$ 为连续函数, 且 $f(x)$ 关于 $x=T$ 对称, $a < T < b$.

证明: $\int_a^b f(x)dx = 2 \int_T^b f(x)dx + \int_a^{2T-b} f(x)dx$

7. 设 $f(x)$ 在 $[a, b]$ 上连续,

$$\text{证明 } \int_a^b f(x)dx = \int_a^b f(a+b-x)dx.$$

8. 证明:

$$\int_0^1 x^m (1-x)^n dx = \int_0^1 x^n (1-x)^m dx.$$

9. 证明:

$$\int_{-a}^a f(x)dx = \int_0^a [f(x) + f(-x)]dx, \text{ 并求 } \int_{-\frac{\pi}{4}}^{\frac{\pi}{4}} \frac{dx}{1 + \sin x}.$$

10. 设 $f(x)$ 在 $[0, 1]$ 上连续,

$$\text{证明 } \int_0^{\frac{\pi}{2}} f(|\cos x|)dx = \frac{1}{4} \int_0^{2\pi} f(|\cos x|)dx.$$

11. 设 $f(x)$ 连续, $f(1)=1$,

且 $\int_0^x tf(2x-t)dt = \frac{1}{2}\arctan x^2$, 求 $\int_1^2 f(x)dx$. ($= 3/4$)

12. 求可导函数 $f(x)$, 使它满足

$$\int_0^1 f(tx)dt = f(x) + x \sin x.$$

$$(f(x) = \cos x - x \sin x + C)$$

1. 设 $f(x)$ 可导,且 $f(0) = 0$, $F(x) = \int_0^x t^{n-1} f(x^n - t^n) dt$

$$\text{求证: } \lim_{x \rightarrow 0} \frac{F(x)}{x^{2n}} = \frac{1}{2n} f'(0)$$

证明 令 $u = x^n - t^n$, $du = -nt^{n-1} dt$, $t : \Big|_0^x \rightarrow u : \Big|_{x^n}^0$

$$F(x) = \int_0^x t^{n-1} f(x^n - t^n) dt = \frac{1}{n} \int_0^{x^n} f(u) du$$

$$F'(x) = x^{n-1} f(x^n)$$

$$\therefore \lim_{x \rightarrow 0} \frac{F(x)}{x^{2n}} = \lim_{x \rightarrow 0} \frac{F'(x)}{2nx^{2n-1}} = \frac{1}{2n} \lim_{x \rightarrow 0} \frac{f(x^n)}{x^n}$$

$$= \frac{1}{2n} \lim_{x \rightarrow 0} \frac{f(x^n) - f(0)}{x^n - 0} = \frac{1}{2n} f'(0)$$

2. 设 $f(x)$ 连续且常数 $a > 0$, 证明:

$$\int_1^a f\left(x^2 + \frac{a^2}{x^2}\right) \frac{dx}{x} = \int_1^a f\left(x + \frac{a^2}{x}\right) \frac{dx}{x}$$

证明

$$\int_1^a f\left(x^2 + \frac{a^2}{x^2}\right) \frac{dx}{x} \stackrel{x^2=u}{\substack{dx=\frac{1}{2x}du}} = \int_1^{a^2} f\left(u + \frac{a^2}{u}\right) \frac{du}{2u}$$

$$= \frac{1}{2} \left[\int_1^{a^2} f\left(u + \frac{a^2}{u}\right) \frac{du}{u} + \int_a^{a^2} f\left(u + \frac{a^2}{u}\right) \frac{du}{u} \right]$$

$$\because \int_a^{a^2} f\left(u + \frac{a^2}{u}\right) \frac{du}{u} \stackrel{u=\frac{a^2}{t}}{=} \int_a^1 f\left(t + \frac{a^2}{t}\right) \frac{t}{a^2} \left(-\frac{a^2 dt}{t^2}\right)$$

$$= \int_1^a f\left(t + \frac{a^2}{t}\right) \frac{1}{t} dt = \int_1^a f\left(u + \frac{a^2}{u}\right) \frac{du}{u}$$

$$\therefore \int_1^a f\left(x^2 + \frac{a^2}{x^2}\right) \frac{dx}{x} = \int_1^a f\left(x + \frac{a^2}{x}\right) \frac{dx}{x}$$

3. 设 $f(x)$ 为连续函数, 证明

$$\int_0^x f(t)(x-t)dt = \int_0^x \left(\int_0^t f(u)du \right) dt$$

证明 设 $\frac{dF(x)}{dx} = f(x)$, 则 $\int_0^t f(u)du = F(t) - F(0)$.

$$\text{右边} = \int_0^x \left(\int_0^t f(u)du \right) dt = \int_0^x (F(t) - F(0)) dt$$

$$\begin{aligned} \text{左边} &= \int_0^x f(t)(x-t)dt = x \int_0^x f(t)dt - \int_0^x tf(t)dt \\ &= x(F(x) - F(0)) - \int_0^x t dF(t) \\ &= x(F(x) - F(0)) - tF(t) \Big|_0^x + \int_0^x F(t)dt \\ &= \int_0^x F(t)dt - xF(0) = \int_0^x (F(t) - F(0))dt. \end{aligned}$$

4 设 $f(x)$ 是连续函数求证：

$$\int_0^{2a} f(x)dx = \int_0^a (f(x) + f(2a-x))dx$$

并计算 $\int_0^\pi \frac{x \sin x}{1 + \sin^2 x} dx$

证明 $\int_0^{2a} f(x)dx = \int_0^a f(x)dx + \int_a^{2a} f(x)dx$

$$\stackrel{2a-t=x}{=} \int_0^a + \int_a^0 f(2a-t)(-dt)$$

$$= \int_0^a [f(x) + f(2a-x)]dx$$

$$\int_0^{\pi} \frac{x \sin x}{1 + \sin^2 x} dx$$

$$= \int_0^{\frac{\pi}{2}} \left[\frac{x \sin x}{1 + \sin^2 x} + \frac{(\pi - x) \sin(\pi - x)}{1 + \sin^2 x} \right] dx$$

$$= \pi \int_0^{\frac{\pi}{2}} \frac{\sin x dx}{1 + \sin^2 x} = -\pi \int_0^{\frac{\pi}{2}} \frac{d \cos x}{2 - \cos^2 x}$$

$$= -\pi \left[\frac{1}{2\sqrt{2}} \ln \frac{\sqrt{2} + \cos x}{\sqrt{2} - \cos x} \right]_0^{\frac{\pi}{2}}$$

$$= \frac{\pi}{2\sqrt{2}} \ln \frac{\sqrt{2} + 1}{\sqrt{2} - 1}$$

5 证明: 设 $f(x)$ 为连续函数, 且当 $0 \leq x \leq \frac{a}{2}$ 时,

$$f(x) + f(a-x) > 0 \quad \text{试证: } \int_0^a f(x) dx > 0$$

证明 $\int_0^a f(x) dx = \int_0^{\frac{a}{2}} f(x) dx + \int_{\frac{a}{2}}^a f(x) dx$

$$\stackrel{a-t=x}{=} \int_0^{\frac{a}{2}} f(x) dx + \int_{\frac{a}{2}}^0 f(a-t)(-dt)$$

$$= \int_0^{\frac{a}{2}} [f(x) + f(a-x)] dx > 0$$

6 设 $f(x)$ 为连续函数,且 $f(x)$ 关于 $x = T$ 对称, $a < T < b$.

证明: $\int_a^b f(x)dx = 2\int_T^b f(x)dx + \int_a^{2T-b} f(x)dx$

提示 $f(x) = f(2T - x)$

$$\int_a^b f(x)dx = \int_a^{2T-b} f(x)dx + \int_{2T-b}^b f(x)dx$$

$$= \int_a^{2T-b} f(x)dx + \int_{2T-b}^T f(x)dx + \int_T^b f(x)dx$$

$$\int_{2T-b}^T f(x)dx \quad \begin{matrix} x = 2T - t \\ = \end{matrix} \int_T^b f(t)dt$$

7. 设 $f(x)$ 在 $[a, b]$ 上连续,

$$\text{证明 } \int_a^b f(x)dx = \int_a^b f(a+b-x)dx.$$

8. 证明:

$$\int_0^1 x^m (1-x)^n dx = \int_0^1 x^n (1-x)^m dx.$$

9. 证明:

$$\int_{-a}^a f(x)dx = \int_0^a [f(x) + f(-x)]dx, \text{ 并求 } \int_{-\frac{\pi}{4}}^{\frac{\pi}{4}} \frac{dx}{1 + \sin x}.$$

10. 设 $f(x)$ 在 $[0, 1]$ 上连续,

$$\text{证明 } \int_0^{\frac{\pi}{2}} f(|\cos x|)dx = \frac{1}{4} \int_0^{2\pi} f(|\cos x|)dx.$$

题7-题10 提示: 用换元法

11. 设 $f(x)$ 连续, $f(1)=1$,

且 $\int_0^x tf(2x-t)dt = \frac{1}{2}\arctan x^2$, 求 $\int_1^2 f(x)dx$.

解 $\int_0^x tf(2x-t)dt = \frac{1}{2}\arctan x^2$

令 $2x-t=u \Rightarrow t=2x-u,$

$dt = -du, \quad t : \Big|_0^x \rightarrow u : \Big|_{2x}^x$

$\int_{2x}^x (2x-u)f(u)(-du) = \frac{1}{2}\arctan x^2$

即 $\int_x^{2x} (2x-u)f(u)du = \frac{1}{2}\arctan x^2$

即 $2x \int_x^{2x} f(u)du - \int_x^{2x} uf(u)du = \frac{1}{2}\arctan x^2$

$$\text{即} \quad 2x \int_x^{2x} f(u) du - \int_x^{2x} u f(u) du = \frac{1}{2} \arctan x^2$$

将上式两边对 x 求导得

$$\begin{aligned} \because \quad & \frac{d}{dx} \left\{ 2x \int_x^{2x} f(u) du - \int_x^{2x} u f(u) du \right\} = \\ & 2 \int_x^{2x} f(u) du + 2x[2f(2x) - f(x)] - [2xf(2x) \cdot 2 - xf(x)] \\ = & 2 \int_x^{2x} f(u) du - xf(x) \quad \frac{d}{dx} \left(\frac{1}{2} \arctan x^2 \right) = \frac{x}{1+x^4} \\ \therefore \quad & 2 \int_x^{2x} f(u) du - xf(x) = \frac{x}{1+x^4} \quad \text{又} \quad f(1) = 1 \end{aligned}$$

$$\text{从而有} \quad \int_1^2 f(x) dx = \frac{1}{2} \left[\frac{x}{1+x^4} + xf(x) \right] \Big|_{x=1} = \frac{3}{4}$$

四、与分部积分有关的题目求解

1. 设 $f(x) = \int_0^x \frac{\sin t}{\pi - t} dt$, 求 $\int_0^\pi f(x) dx$. (2)

2. 设 $f(x) = \int_0^x e^{-y^2+2y} dy$, 求 $\int_0^1 (x-1)^2 f(x) dx$.
($-\frac{1}{6}(e-2)$)

3. 若 $f''(x)$ 在 $[0, \pi]$ 连续, $f(0) = 2$, $f(\pi) = 1$,
证明: $\int_0^\pi [f(x) + f''(x)] \sin x dx = 3$.

4. 设 $f(x)$ 在 $[0, 1]$ 上有二阶连续导数, 证明:

$$\int_0^1 f(x) dx = \frac{1}{2}[f(0) + f(1)] - \frac{1}{2} \int_0^1 x(1-x) f''(x) dx.$$

5. 积分第二中值定理

设 $f(x) \in C[a, b]$, $g'(x) \in C[a, b]$, 且 $g'(x)$ 不变号
则 $\exists \xi \in [a, b]$, 使得

$$\int_a^b f(x)g(x)dx = g(a)\int_a^{\xi} f(x)dx + g(b)\int_{\xi}^b f(x)dx$$

6. 设 $I_n = \int_0^{\frac{\pi}{4}} \tan^n x dx$ 其中 $n \geq 1$

证明:
$$I_n = \frac{1}{n-1} - I_{n-2} \quad n \geq 2$$

$$2I_n \in \left(\frac{1}{n+1}, \frac{1}{n-1} \right) \quad n \geq 2$$

2. 设 $f(x) = \int_0^x e^{-y^2+2y} dy$, 求 $\int_0^1 (x-1)^2 f(x) dx$.

解 因为 e^{-y^2+2y} 没有初等形式的原函数,
无法直接求出 $f(x)$, 所以采用分部积分法

$$\begin{aligned}\int_0^1 (x-1)^2 f(x) dx &= \frac{1}{3} \int_0^1 f(x) d(x-1)^3 \\&= \frac{1}{3} \left[(x-1)^3 f(x) \right]_0^1 - \frac{1}{3} \int_0^1 (x-1)^3 df(x) \\&= -\frac{1}{3} f(0) - \frac{1}{3} \int_0^1 (x-1)^3 f'(x) dx\end{aligned}$$

$$\int_0^1 (x-1)^2 f(x) dx = -\frac{1}{3} f(0) - \frac{1}{3} \int_0^1 (x-1)^3 f'(x) dx$$

$$\because f(x) = \int_0^x e^{-y^2+2y} dy, \quad f(0) = \int_0^0 e^{-y^2+2y} dy = 0,$$

$$f'(x) = e^{-x^2+2x}$$

$$\int_0^1 (x-1)^2 f(x) dx = -\frac{1}{3} \int_0^1 (x-1)^3 e^{-x^2+2x} dx$$

$$= -\frac{1}{6} \int_0^1 (x-1)^2 e^{-(x-1)^2+1} d[(x-1)^2]$$

$$\underline{\underline{\text{令 } (x-1)^2 = u}} - \frac{e}{6} \int_1^0 u e^{-u} du = -\frac{1}{6}(e-2).$$

5. 积分第二中值定理

设 $f(x) \in C[a, b]$, $g'(x) \in C[a, b]$, 且 $g'(x)$ 不变号
则 $\exists \xi \in [a, b]$, 使得

$$\int_a^b f(x)g(x)dx = g(a)\int_a^{\xi} f(x)dx + g(b)\int_{\xi}^b f(x)dx$$

提示: 令 $F(x) = \int_a^x f(t)dt$

用分部积分法和积分中值定理

6. 设 $I_n = \int_0^{\frac{\pi}{4}} \tan^n x dx$ 其中 $n \geq 1$

证明: $I_n = \frac{1}{n-1} - I_{n-2} \quad n \geq 2$

$$2I_n \in \left(\frac{1}{n+1}, \frac{1}{n-1} \right) \quad n \geq 2$$

证明 $I_n = \int_0^{\frac{\pi}{4}} \tan^{n-2} x \tan^2 x dx = \int_0^{\frac{\pi}{4}} \tan^{n-2} x (\sec^2 x - 1) dx$

$$= \int_0^{\frac{\pi}{4}} \tan^{n-2} x d \tan x - I_{n-2} = \frac{1}{n-1} - I_{n-2}$$

$$I_n = \frac{1}{n-1} - I_{n-2} \quad n \geq 2$$

$$\because x \in [0, \frac{\pi}{4}], \tan^n x \geq \tan^{n+2} x$$

$$\therefore \int_0^{\frac{\pi}{4}} \tan^n x dx > \int_0^{\frac{\pi}{4}} \tan^{n+2} x dx, i.e., I_n > I_{n+2}$$

$$\therefore I_n + I_{n+2} < 2I_n < I_n + I_{n-2},$$

$$\text{即 } 2I_n \in \left(\frac{1}{n+1}, \frac{1}{n-1} \right) \quad n \geq 2$$

五、综合极限，定积分概念，解方程

1. 设 $f(x)$ 是连续函数，且 $f(x) = x + 2\int_0^1 f(t)dt$ ，
则 $f(x) = \underline{x-1}$.

2. 设 $f(x) = x^2 - x\int_0^2 f(x)dx + 2\int_0^1 f(x)dx$
求 $f(x)$. ($f(x) = x^2 - \frac{4}{3}x + \frac{2}{3}$)

3. 设 $f(x) = x - 2\int_0^\pi f(t)\cos t dt$, 求 $f(x)$ ($f(x) = x + 2$)

4. 设 $f(x)$ 当 $x \rightarrow 1$ 时其极限存在，在 $[0,1]$ 上可积，
且恒有 $f(x) = 3x^2 + 4x - 2\int_0^1 f(x)dx - 3\lim_{x \rightarrow 1} f(x)$
求 $f(x)$.

(令 $\lim_{x \rightarrow 1} f(x) = a, \int_0^1 f(x)dx = b, f(x) = 3x^2 + 4x - 9/2$.)

9. 设 $f(x)$ 在 $[0, a]$ 上连续, 在 $(0, a)$ 内可导, 且 $3 \int_{\frac{2a}{3}}^a f(x) dx = f(0)a$. 证明: 存在 $\xi \in (0, a)$ 使 $f'(\xi) = 0$.

10. 设 $f(x)$ 在 $[0, 2]$ 上连续, 在 $(0, 2)$ 内二阶可导, 且 $2 \int_{\frac{1}{2}}^1 f(x) dx = f(2), f\left(\frac{1}{2}\right) = f(0)$. 证明: 存在 $\xi \in (0, 2)$ 使 $f''(\xi) = 0$.

证明：用积分中值定理和罗尔定理

44 求可导函数 $f(x)$, 使它满足 $\int_0^1 f(tx) dt = f(x) + x \sin x$.

解: 令 $u = tx$, 则 $du = x dt$. 从而 $\int_0^1 f(tx) dt = \int_0^x f(u) \cdot \frac{1}{x} du = \frac{1}{x} \int_0^x f(u) du$,
于是 $\int_0^1 f(tx) dt = f(x) + x \sin x$ 可化为 $\frac{1}{x} \int_0^x f(u) du = f(x) + x \sin x$, 即为
 $\int_0^x f(u) du = x f(x) + x^2 \sin x$, 对该等式两边关于 x 求导可得 $f(x) = f(x) + x f'(x) + 2x \sin x$
 $+ x^2 \cos x$, 即有 $f'(x) = -2 \sin x - x \cos x$, 从而 $f(x) = \int (-2 \sin x - x \cos x) dx = -2 \int \sin x dx$
 $- \int x \cos x dx = \cos x - x \sin x + C$.

1. 设 $f(x)$ 是连续函数, 且 $f(x) = x + 2\int_0^1 f(t)dt$,
则 $f(x) = \underline{\hspace{2cm}}$.

解 设 $\int_0^1 f(t)dt = I$, 于是 $f(x) = x + 2I$,

两边在 $[0, 1]$ 上积分

$$\int_0^1 f(t)dt = \int_0^1 f(x)dx + 2I \int_0^1 dx,$$

$$\text{即: } I = \frac{1}{2} + 2I, I = -\frac{1}{2} \quad \therefore f(x) = x - 1.$$

2. 设 $f(x) = x^2 - x \int_0^2 f(x) dx + 2 \int_0^1 f(x) dx$, 求 $f(x)$.

解 定积分为常数, 故应用积分法定此常数.

设 $\int_0^1 f(x) dx = a$, $\int_0^2 f(x) dx = b$, 则

$$f(x) = x^2 - bx + 2a$$

$$a = \int_0^1 f(x) dx = \left[\frac{x^3}{3} - \frac{bx^2}{2} + 2ax \right]_0^1 = \frac{1}{3} - \frac{b}{2} + 2a$$

$$b = \int_0^2 f(x) dx = \left[\frac{x^3}{3} - \frac{bx^2}{2} + 2ax \right]_0^2 = \frac{8}{3} - 2b + 4a$$

$$\Rightarrow a = \frac{1}{3}, b = \frac{4}{3} \Rightarrow f(x) = x^2 - \frac{4}{3}x + \frac{2}{3}$$

六、积分不等式性质

1. 估计下列积分 $\int_{\frac{\sqrt{3}}{3}}^{\sqrt{3}} x \arccot x dx$ 的值 .

提示：求被积函数在积分区间上的最大最小值

$$\left(\frac{\pi}{9} \leq \int_{\frac{1}{\sqrt{3}}}^{\sqrt{3}} x \arctan x dx \leq \frac{2}{3}\pi \right)$$

2. 证明 $\frac{1}{2} \leq \int_0^1 \frac{1}{\sqrt{4-x^2+x^3}} dx \leq \frac{\pi}{6}$

3. 证明 $\ln(1+\sqrt{2}) \leq \int_0^1 \frac{1}{\sqrt{1+x^4}} dx \leq 1$

4. 证明 $\frac{p}{p+1} \leq \int_0^1 \frac{1}{1+x^p} dx \leq 1 \quad (p > 0)$

2. 证明 $\frac{1}{2} \leq \int_0^1 \frac{1}{\sqrt{4-x^2+x^3}} dx \leq \frac{\pi}{6}$

解 因为 $\frac{1}{\sqrt{4}} \leq \frac{1}{\sqrt{4-x^2+x^3}} \leq \frac{1}{\sqrt{4-x^2}}, x \in [0, 1]$

$$\therefore \int_0^1 \frac{1}{2} dx \leq \int_0^1 \frac{1}{\sqrt{4-x^2+x^3}} dx \leq \int_0^1 \frac{1}{\sqrt{4-x^2}} dx$$

即 $\frac{1}{2} \leq \int_0^1 \frac{1}{\sqrt{4-x^2+x^3}} dx \leq \frac{\pi}{6}$

七、积分不等式证明

1. 设 $f(x), g(x)$ 在 $[a, b]$ 上连续, 试证: 柯西 - 许瓦兹不等式

$$\left(\int_a^b f(x)g(x)dx \right)^2 \leq \int_a^b f^2(x)dx \int_a^b g^2(x)dx$$

2. 设 $f(x)$ 在区间 $[a, b]$ 上连续, 且 $f(x) > 0$.

$$\text{证明 } \int_a^b f(x)dx \cdot \int_a^b \frac{dx}{f(x)} \geq (b-a)^2.$$

3. 设 $f(x) \in C[a, b]$, 且 $f(x)$ 单调上升,

$$\text{证明: } \int_a^b xf(x)dx \geq \frac{a+b}{2} \int_a^b f(x)dx.$$

4. 设 $f(x)$ 在 $[0, 1]$ 上有连续导数, $f(0) = 0$,
且 $0 < f'(x) \leq 1$, 试证:

$$\left[\int_0^1 f(x) dx \right]^2 \geq \int_0^1 [f(x)]^3 dx.$$

5. 设 $x \in [a, b]$, $f''(x) \geq 0$, 证明:

$$f\left(\frac{a+b}{2}\right) \leq \frac{1}{b-a} \int_a^b f(x) dx \leq \frac{f(a) + f(b)}{2}.$$

6. 设 $f(x)$ 在 $[0, 1]$ 上是单调递减的连续函数,
试证明对于任何 $q \in (0, 1)$ 都有不等式

$$\int_0^q f(x) dx \geq q \int_0^1 f(x) dx$$

7 . 设 $f(x)$ 在 $[a, b]$ 上存在连续导数 $f(a)=0$, $\max_{[a,b]} |f'(x)| = M$

求证: $\frac{2}{(b-a)^2} \left| \int_a^b f(x) dx \right| \leq M$

1. 设 $f(x), g(x)$ 在 $[a, b]$ 上连续, 试证:
柯西-许瓦兹不等式

$$\left(\int_a^b f(x)g(x)dx \right)^2 \leq \int_a^b f^2(x)dx \int_a^b g^2(x)dx$$

证明 $\because (tf(x) - g(x))^2 \geq 0,$

$$\therefore \int_a^b (tf(x) - g(x))^2 dx \geq 0$$

$$\text{即, } t^2 \int_a^b f^2(x)dx - 2t \int_a^b f(x)g(x)dx + \int_a^b g^2(x)dx \geq 0$$

$$\therefore \left(\int_a^b f(x)g(x)dx \right)^2 - \int_a^b f^2(x)dx \int_a^b g^2(x)dx \leq 0$$

$$\therefore \left(\int_a^b f(x)g(x)dx \right)^2 \leq \int_a^b f^2(x)dx \int_a^b g^2(x)dx$$

证法2 作辅助函数（构造变上限积分），

$$F(x) = \left(\int_a^x f(t)g(t)dt \right)^2 - \int_a^x f^2(t)dt \int_a^x g^2(t)dt$$

$$\therefore F(a) = 0$$

$$\begin{aligned} F'(x) &= 2\left(\int_a^x f(t)g(t)dt\right)f(x)g(x) \\ &\quad - f^2(x)\int_a^x g^2(t)dt - g^2(x)\int_a^x f^2(t)dt \\ &= -\int_a^x (f(t)g(x) - f(x)g(t))^2 dt \leq 0 \end{aligned}$$

$$\therefore F(x) \leq 0$$

$$\text{故 } \left(\int_a^x f(t)g(t)dt \right)^2 \leq \int_a^x f^2(t)dt \int_a^x g^2(t)dt$$

2. 设 $f(x)$ 在区间 $[a, b]$ 上连续, 且 $f(x) > 0$.

证明 $\int_a^b f(x)dx \cdot \int_a^b \frac{dx}{f(x)} \geq (b-a)^2$.

证法1 $\because f(x) > 0$, 由1得,

$$\begin{aligned} & \int_a^b f(x)dx \cdot \int_a^b \frac{1}{f(x)}dx \\ &= \int_a^b (\sqrt{f(x)})^2 dx \cdot \int_a^b \frac{1}{(\sqrt{f(x)})^2} dx \\ &\geq \left(\int_a^b \sqrt{f(x)} \frac{1}{\sqrt{f(x)}} dx \right)^2 \geq (b-a)^2 \end{aligned}$$

2. 设 $f(x)$ 在区间 $[a, b]$ 上连续, 且 $f(x) > 0$.

证明 $\int_a^b f(x)dx \cdot \int_a^b \frac{dx}{f(x)} \geq (b-a)^2$.

证法2 作辅助函数 (构造变上限积分)

$$F(x) = \int_a^x f(t)dt \int_a^x \frac{dt}{f(t)} - (x-a)^2,$$

$$\because F'(x) = f(x) \int_a^x \frac{1}{f(t)}dt + \int_a^x f(t)dt \cdot \frac{1}{f(x)} - 2(x-a)$$

$$= \int_a^x \frac{f(x)}{f(t)}dt + \int_a^x \frac{f(t)}{f(x)}dt - \int_a^x 2dt,$$

$$\because f(x) > 0, \quad \therefore \frac{f(x)}{f(t)} + \frac{f(t)}{f(x)} \geq 2$$

$$\text{即 } F'(x) = \int_a^x \left(\frac{f(x)}{f(t)} + \frac{f(t)}{f(x)} - 2 \right) dt \geq 0$$

$F(x)$ 单调增加.

$$\text{又 } \because F(a) = 0, \quad \therefore F(b) \geq F(a) = 0,$$

$$\text{即 } \int_a^b f(x) dx \cdot \int_a^b \frac{dx}{f(x)} \geq (b-a)^2.$$

3. 设 $f(x) \in C[a, b]$, 且 $f(x)$ 单调上升,

$$\text{证明: } \int_a^b xf(x)dx \geq \frac{a+b}{2} \int_a^b f(x)dx.$$

证法1 构造变上限积分

$$\text{Let } F(x) = \int_a^x xf(x)dx - \frac{a+x}{2} \int_a^x f(x)dx$$

$$\text{Then } F(a) = 0$$

$$\begin{aligned} F'(x) &= xf(x) - \frac{1}{2} \int_a^x f(x)dx - \frac{a+x}{2} f(x) \\ &= \frac{x-a}{2} f(x) - \frac{1}{2} \int_a^x f(x)dx \geq \frac{x-a}{2} f(x) - \frac{x-a}{2} f(x) = 0 \end{aligned}$$

$$\therefore F(x) \geq 0 \quad x \in [a, b], \quad F(b) \geq 0 \quad \text{holds}$$

3. 设 $f(x) \in C[a, b]$, 且 $f(x)$ 单调上升,

$$\text{证明: } \int_a^b xf(x)dx \geq \frac{a+b}{2} \int_a^b f(x)dx.$$

证法2 $\int_a^b (x - \frac{a+b}{2}) f(x) dx =$

$$= \int_a^{\frac{a+b}{2}} (x - \frac{a+b}{2}) f(x) dx + \int_{\frac{a+b}{2}}^b (x - \frac{a+b}{2}) f(x) dx$$

$$= f(\xi_1) \int_a^{\frac{a+b}{2}} (x - \frac{a+b}{2}) dx + f(\xi_2) \int_{\frac{a+b}{2}}^b (x - \frac{a+b}{2}) dx$$

$$= \frac{(a+b)^2}{2} [f(\xi_2) - f(\xi_1)] \geq 0$$

$$\xi_1 \in [a, \frac{a+b}{2}], \xi_2 \in [\frac{a+b}{2}, b]$$

3. 设 $f(x) \in C[a, b]$, 且 $f(x)$ 单调上升,

$$\text{证明: } \int_a^b xf(x)dx \geq \frac{a+b}{2} \int_a^b f(x)dx.$$

证法3 $\because f(x) \uparrow$

$$\therefore (x - \frac{a+b}{2})[f(x) - f(\frac{a+b}{2})] \geq 0$$

$$\text{then } \int_a^b (x - \frac{a+b}{2})[f(x) - f(\frac{a+b}{2})]dx \geq 0$$

$$\text{that is } \int_a^b (x - \frac{a+b}{2})f(x)dx \geq \int_a^b (x - \frac{a+b}{2})f(\frac{a+b}{2})dx = 0$$

$$\text{We have } \int_a^b xf(x)dx \geq \frac{a+b}{2} \int_a^b f(x)dx.$$

4. 设 $f(x)$ 在 $[0, 1]$ 上有连续导数, $f(0) = 0$,
且 $0 < f'(x) \leq 1$, 试证:

$$\left[\int_0^1 f(x) dx \right]^2 \geq \int_0^1 [f(x)]^3 dx.$$

证明 类似于上一题的方法1构造变上限函数

5. 设 $x \in [a, b]$, $f''(x) \geq 0$, 证明:

$$f\left(\frac{a+b}{2}\right) \leq \frac{1}{b-a} \int_a^b f(x) dx \leq \frac{f(a) + f(b)}{2}.$$

证法1 构造变上限积分

$$F(x) = \frac{f(a) + f(x)}{2} (x - a) - \int_a^x f(x) dx$$

$$G(x) = \int_a^x f(x) dx - (x - a) f\left(\frac{a+x}{2}\right)$$

5. 设 $x \in [a, b]$, $f''(x) \geq 0$, 证明:

$$f\left(\frac{a+b}{2}\right) \leq \frac{1}{b-a} \int_a^b f(x) dx \leq \frac{f(a) + f(b)}{2}.$$

证法2 对不等式的左边

取 $x_0 = \frac{a+b}{2}$, 将 $f(x)$ 在 x_0 处的展成一阶Taylor

$$f(x) = f(x_0) + f'(x_0)(x - x_0) + \frac{1}{2} f''(\xi)(x - x_0)^2$$

再作积分。

注意到: $\int_a^b (x - x_0) dx = 0$

证法2 对不等式的右边

$$\frac{f(x) - f(a)}{x - a} = f'(\xi_1) \quad a < \xi_1 < x$$

$$\frac{f(x) - f(b)}{x - b} = f'(\xi_2) \quad x < \xi_2 < b$$

$$\Rightarrow \frac{f(x) - f(a)}{x - a} \leq \frac{f(b) - f(x)}{b - x}$$

$$\Rightarrow (b - a)f(x) \leq (x - a)f(b) + (b - x)f(a)$$

$$\int_a^b (b - a)f(x)dx \leq \int_a^b [(x - a)f(b) + (b - x)f(a)]dx$$

$$= \frac{f(a) + f(b)}{2} (b - a)^2$$

6. 设 $f(x)$ 在 $[0,1]$ 上是单调递减的连续函数,
试证明对于任何 $q \in (0,1)$ 都有不等式

$$\int_0^q f(x) dx \geq q \int_0^1 f(x) dx$$

证法1 利用定积分性质

$$\int_0^q f(x) dx - q \int_0^1 f(x) dx$$

$$= (1-q) \int_0^q f(x) dx - q \int_q^1 f(x) dx$$

$$= (1-q) \cdot q \cdot f(\xi_1) - q \cdot (1-q) \cdot f(\xi_2) \quad (\text{用积分中值定理})$$

$$= q(1-q)[f(\xi_1) - f(\xi_2)] \geq 0 \quad \xi_1 \in [0, q] \quad \xi_2 \in [q, 1]$$

故所给不等式成立 .

6. 设 $f(x)$ 在 $[0,1]$ 上是单调递减的连续函数,
试证明对于任何 $q \in (0,1)$ 都有不等式

$$\int_0^q f(x) dx \geq q \int_0^1 f(x) dx$$

证法2 换元法 令 $x = qt$, 则

$$\int_0^q f(x) dx = q \int_0^1 f(qt) dt = q \int_0^1 f(qx) dx$$

$$\begin{aligned} & \int_0^q f(x) dx - q \int_0^1 f(x) dx \\ &= q \int_0^1 f(qx) dx - q \int_0^1 f(x) dx \\ &= q \cdot \int_0^1 [f(qx) - f(x)] dx \geq 0 \end{aligned}$$

6. 设 $f(x)$ 在 $[0,1]$ 上是单调递减的连续函数,
试证明对于任何 $q \in (0,1)$ 都有不等式

$$\int_0^q f(x) dx \geq q \int_0^1 f(x) dx$$

证法3 即要证 $1 \cdot \int_0^q f(x) dx - q \int_0^1 f(x) dx \geq 0$

$$\text{令 } F(x) = x \cdot \int_0^q f(t) dt - q \int_0^x f(t) dt \quad x \in [q,1]$$

$$\text{只须证 } F(x) \geq 0 \quad x \in [q,1] \quad \because F(q) = 0$$

$$F'(x) = \int_0^q f(t) dt - q f(x) = \int_0^q [f(t) - f(x)] dt \geq 0$$

$\therefore F(x) \uparrow$, 从而有

$$F(1) = \int_0^q f(t) dt - q \int_0^1 f(t) dt \geq F(q) = 0$$

6. 设 $f(x)$ 在 $[0,1]$ 上是单调递减的连续函数,
试证明对于任何 $q \in (0,1)$ 都有不等式

$$\int_0^q f(x) dx \geq q \int_0^1 f(x) dx$$

证法4 即要证 $\frac{\int_0^q f(x) dx}{q} \geq \frac{\int_0^1 f(x) dx}{1}$

只须证 $F(x) = \frac{\int_0^x f(t) dt}{x} \quad \downarrow$

$$F'(x) = \frac{xf(x) - \int_0^x f(t) dt}{x^2} = \frac{\int_0^x [f(x) - f(t)] dt}{x^2} \leq 0$$

$$\therefore F(q) \geq F(1) \Rightarrow \int_0^q f(x) dx \geq q \int_0^1 f(x) dx$$

7. 设 $f(x)$ 在 $[a, b]$ 上存在连续导数 $f(a)=0$, $\max_{[a,b]} |f'(x)| = M$

求证: $\frac{2}{(b-a)^2} \left| \int_a^b f(x) dx \right| \leq M$

证法1: 由拉格朗日中值定理, 在 $[a, x]$ 上

$$f(x) = f(x) - f(a) = f'(\xi)(x-a) \quad a < \xi < x$$

$$|f(x)| = |f'(\xi)|(x-a) \leq M(x-a)$$

$$\text{则} \quad \int_a^b |f(x)| dx \leq \int_a^b M(x-a) dx = M \frac{(b-a)^2}{2}$$

7. 设 $f(x)$ 在 $[a, b]$ 上存在连续导数 $f(a)=0$, $\max_{[a,b]} |f'(x)| = M$

求证: $\frac{2}{(b-a)^2} \left| \int_a^b f(x) dx \right| \leq M$

证法2: $f(x) = \int_a^x f'(t) dt \Rightarrow$

$$|f(x)| \leq \int_a^x |f'(t)| dt \leq M(x-a)$$

则 $\int_a^b |f(x)| dx \leq \int_a^b M(x-a) dx = M \frac{(b-a)^2}{2}$

八、其它证明题

1. 设 $f(x) \in C[A, B]$, $A < a < b < B$, 证明:

$$\lim_{h \rightarrow 0} \int_a^b \frac{f(x+h) - f(x)}{h} dx = f(b) - f(a)$$

2. 设 $f(x)$ 是周期为 T 的连续函数, 证明:

$$\lim_{x \rightarrow \infty} \frac{1}{x} \int_0^x f(x) dx = \frac{1}{T} \int_0^T f(x) dx$$

---周期函数的一个性质

1. 设 $f(x) \in C[A, B]$, $A < a < b < B$, 证明:

$$\lim_{h \rightarrow 0} \int_a^b \frac{f(x+h) - f(x)}{h} dx = f(b) - f(a)$$

方法1 $\because f(x) \in C[A, B]$,

$\therefore F(x) = \int_a^x f(x) dx$ 是 $f(x)$ 的一个原函数,

即, $F'(x) = f(x)$

$$\lim_{h \rightarrow 0} \int_a^b \frac{f(x+h) - f(x)}{h} dx = \lim_{h \rightarrow 0} \frac{1}{h} \int_a^b [f(x+h) - f(x)] dx$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \left[\int_a^b f(x+h) dx - \int_a^b f(x) dx \right]$$

方法1 $\because f(x) \in C[A, B],$

$\therefore F(x) = \int_a^x f(x)dx$ 是 $f(x)$ 的一个原函数,

即, $F'(x) = f(x)$

$$\lim_{h \rightarrow 0} \int_a^b \frac{f(x+h) - f(x)}{h} dx = \lim_{h \rightarrow 0} \frac{1}{h} \int_a^b [f(x+h) - f(x)] dx$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} \left[\int_a^b f(x+h) dx - \int_a^b f(x) dx \right]$$

$$= \lim_{h \rightarrow 0} \frac{1}{h} [F(b+h) - F(a+h) - F(b) + F(a)]$$

$$= \lim_{h \rightarrow 0} \left[\frac{F(b+h) - F(b)}{h} - \frac{F(a+h) - F(a)}{h} \right]$$

$$= F'(b) - F'(a) = f(b) - f(a)$$

方法2 令 $x + h = t$, 则 $\int_a^b f(x + h)dx = \int_{a+h}^{b+h} f(t)dt$

从而, $\lim_{h \rightarrow 0} \int_a^b \frac{f(x + h) - f(x)}{h} dx$

$$= \lim_{h \rightarrow 0} \frac{\int_a^b [f(x + h) - f(x)] dx}{h}$$

$$= \lim_{h \rightarrow 0} \frac{\int_{a+h}^{b+h} f(t) dt - \int_a^b f(t) dt}{h}$$

$$= \lim_{h \rightarrow 0} \frac{f(b + h) - f(a + h)}{1} = f(b) - f(a)$$

2. 设 $f(x)$ 是周期为 T 的连续函数, 证明:

$$\lim_{x \rightarrow \infty} \frac{1}{x} \int_0^x f(x) dx = \frac{1}{T} \int_0^T f(x) dx$$

证明 $\lim_{x \rightarrow \infty} \frac{1}{x} \int_0^x f(x) dx$

$$\begin{aligned} & \text{令 } x := nT + \alpha \\ & \quad 0 \leq \alpha \leq T \\ & = \lim_{n \rightarrow \infty} \frac{\int_0^{nT} f(t) dt + \int_{nT}^{nT+\alpha} f(t) dt}{nT + \alpha} \end{aligned}$$

$$\begin{aligned} & \text{令 } t = u + nT \\ & = \lim_{n \rightarrow \infty} \frac{n \int_0^T f(t) dt + \int_0^\alpha f(u) dt}{nT + \alpha} \end{aligned}$$

$$= \frac{1}{T} \int_0^T f(x) dx$$

课堂练习

一、求下列定积分

$$1) \int_0^a x^2 \sqrt{a^2 - x^2} dx$$

$$2) \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sqrt{\cos x - \cos^3 x} dx$$

$$3) \int_{\frac{3}{4}}^1 \frac{dx}{\sqrt{1-x}-1}$$

$$4) \int_0^{2a} x^2 \sqrt{2ax - x^2} dx$$

$$5) \int_0^1 (1 - x^2)^{\frac{m}{2}} dx \quad (m \text{ 为自然数})$$

二、已知 $f(0) = 2, f(\pi) = 1$. 求证 :

$$\int_0^\pi [f(x) + f''(x)] \sin x dx = 3$$

一、解

$$1) \int_0^a x^2 \sqrt{a^2 - x^2} dx$$

$$\stackrel{\text{令 } x=a \sin t}{=} \int_0^{\frac{\pi}{2}} a^2 \sin^2 t \cdot a \cos t \cdot a \cos t dt$$

$$= \int_0^{\frac{\pi}{2}} \frac{1 - \cos 4t}{8} dt$$

$$= \frac{a^4}{8} \left[t - \frac{1}{4} \sin 4t \right]_0^{\frac{\pi}{2}} = \frac{\pi}{16} a^4$$

$$2) \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sqrt{\cos x - \cos^3 x} dx = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \sqrt{\cos x} |\sin x| dx$$

$$= -2 \int_0^{\frac{\pi}{2}} \sqrt{\cos x} d \cos x = -2 \left[\frac{1}{3} \cos^{\frac{3}{2}} x \right]_0^{\frac{\pi}{2}} = 2$$

$$\begin{aligned}
 3) \quad \int_{\frac{3}{4}}^1 \frac{dx}{\sqrt{1-x}-1} & \stackrel{\text{令 } \sqrt{1-x}=t}{=} \int_{\frac{1}{2}}^0 \frac{-2t dt}{t-1} \\
 &= \int_0^{\frac{1}{2}} \frac{2t dt}{t-1} = 2 \cdot \frac{1}{2} + 2 \ln \left| \frac{1}{2} \right| \\
 &= 1 - 2 \ln 2
 \end{aligned}$$

$$\begin{aligned}
 4) \int_0^{2a} x^2 \sqrt{2ax - x^2} dx & \stackrel{x-a=t}{=} \int_{-a}^a (t+a)^2 \sqrt{a^2 - t^2} dt \\
 &= 2 \int_0^a (t+a)^2 \sqrt{a^2 - t^2} dt
 \end{aligned}$$

$$5) \int_0^1 (1-x^2)^{\frac{m}{2}} dx \quad (m \text{ 为自然数})$$

$$\begin{aligned} & \text{令 } x = \sin t \\ & = \int_0^{\frac{\pi}{2}} \cos^m x \cdot \cos x dx = \int_0^{\frac{\pi}{2}} \cos^{m+1} x dx \end{aligned}$$

$$= I_{m+1} = \frac{m+1-1}{m+1} I_{m-1}$$

课堂练习

一、计算下列积分

$$\begin{aligned} 1 \quad & \text{求 } \int_0^{\frac{\pi}{2}} \sqrt{1 - \sin 2x} dx. \\ & = 2\sqrt{2} - 2. \end{aligned}$$

$$\begin{aligned} 2 \quad & \text{求 } \int_0^{\ln 2} \sqrt{1 - e^{-2x}} dx. \\ & = \ln(2 + \sqrt{3}) - \frac{\sqrt{3}}{2}. \end{aligned}$$

$$3 \quad \text{求 } \int_{-\frac{1}{2}}^{\frac{1}{2}} \left[\frac{\sin x}{x^8 + 1} + \sqrt{\ln^2(1 - x)} \right] dx.$$

$$7 \quad \text{求 } \int_0^{\pi} \sin^6 \frac{x}{2} dx = \frac{5\pi}{16}.$$

$$4. \quad \int_0^a x^2 \sqrt{a^2 - x^2} dx = \frac{\pi}{16} a^4$$

$$5. \quad \int_0^{2a} x^2 \sqrt{2ax - x^2} dx = \frac{5\pi}{8} a^4$$

$$\begin{aligned} 6. \quad & \text{求 } \int_{-2}^2 \min\left\{\frac{1}{|x|}, x^2\right\} dx. \\ & = \frac{3}{2} \ln \frac{3}{2} + \ln \frac{1}{2}. \end{aligned}$$

一、计算下列积分

1 求 $\int_0^{\frac{\pi}{2}} \sqrt{1 - \sin 2x} dx$.

解 原式 $= \int_0^{\frac{\pi}{2}} |\sin x - \cos x| dx$

$$= \int_0^{\frac{\pi}{4}} (\cos x - \sin x) dx + \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} (\sin x - \cos x) dx$$
$$= 2\sqrt{2} - 2.$$

2 求 $\int_0^{\ln 2} \sqrt{1 - e^{-2x}} dx.$

解 令 $e^{-x} = \sin t,$

x	0	$\ln 2$
t	$\frac{\pi}{2}$	$\frac{\pi}{6}$

则 $x = -\ln \sin t, dx = -\frac{\cos t}{\sin t} dt.$

原式 $= \int_{\frac{\pi}{2}}^{\frac{\pi}{6}} \cos t \left(-\frac{\cos t}{\sin t} \right) dt = \int_{\frac{\pi}{6}}^{\frac{\pi}{2}} \frac{\cos^2 t}{\sin t} dt$

$= \int_{\frac{\pi}{6}}^{\frac{\pi}{2}} \frac{dt}{\sin t} - \int_{\frac{\pi}{6}}^{\frac{\pi}{2}} \sin t dt = \ln(2 + \sqrt{3}) - \frac{\sqrt{3}}{2}.$

3 求 $\int_{-\frac{1}{2}}^{\frac{1}{2}} \left[\frac{\sin x}{x^8 + 1} + \sqrt{\ln^2(1-x)} \right] dx = \frac{3}{2} \ln \frac{3}{2} + \frac{1}{2} \ln \frac{1}{2}.$

解 原式 $= 0 + \int_{-\frac{1}{2}}^{\frac{1}{2}} |\ln(1-x)| dx$

$$= \int_{-\frac{1}{2}}^0 \ln(1-x) dx - \int_0^{\frac{1}{2}} \ln(1-x) dx$$
$$= \frac{3}{2} \ln \frac{3}{2} + \frac{1}{2} \ln \frac{1}{2}.$$

4. $\int_0^a x^2 \sqrt{a^2 - x^2} dx$

解

$$\begin{aligned} & \int_0^a x^2 \sqrt{a^2 - x^2} dx \\ & \stackrel{\text{令 } x=a \sin t}{=} \int_0^{\frac{\pi}{2}} a^2 \sin^2 t \cdot a \cos t \cdot a \cos t dt \\ & = \int_0^{\frac{\pi}{2}} \frac{1 - \cos 4t}{8} dt \\ & = \frac{a^4}{8} \left[t - \frac{1}{4} \sin 4t \right]_0^{\frac{\pi}{2}} = \frac{\pi}{16} a^4 \end{aligned}$$

5. $\int_0^{2a} x^2 \sqrt{2ax - x^2} dx$

解 $\int_0^{2a} x^2 \sqrt{2ax - x^2} dx \stackrel{x-a=t}{=} \int_{-a}^a (t+a)^2 \sqrt{a^2 - t^2} dt$

$$= 2 \int_0^a (t^2 + a^2) \sqrt{a^2 - t^2} dt$$
$$= \frac{5\pi}{8} a^4$$

6. 求 $\int_{-2}^2 \min\{\frac{1}{|x|}, x^2\} dx$.

解 $\because \min\{\frac{1}{|x|}, x^2\} = \begin{cases} x^2, & |x| \leq 1 \\ \frac{1}{|x|}, & |x| > 1 \end{cases}$ 是偶函数,

$$\text{原式} = 2 \int_0^2 \min\{\frac{1}{x}, x^2\} dx$$

$$= 2 \int_0^1 x^2 dx + 2 \int_1^2 \frac{1}{x} dx = \frac{2}{3} + 2 \ln 2.$$

7 求 $\int_0^{\pi} \sin^6 \frac{x}{2} dx$.

解: $\int_0^{\pi} \sin^6 \frac{x}{2} dx = \int_0^{\frac{\pi}{2}} \sin^6 t d2t$

$$= 2 \int_0^{\frac{\pi}{2}} \sin^6 t dt = 2 \frac{5 \cdot 3 \cdot 1}{6 \cdot 4 \cdot 2} \frac{\pi}{2} = \frac{5\pi}{16}.$$

二、求下列广义积分：

$$(1) \int_{-\infty}^{+\infty} \frac{dx}{x^2 + 4x + 9}; \quad (2) \int_1^2 \frac{dx}{x\sqrt{3x^2 - 2x - 1}}.$$

解

$$\begin{aligned} \text{原式} &= \int_{-\infty}^0 \frac{dx}{x^2 + 4x + 9} + \int_0^{+\infty} \frac{dx}{x^2 + 4x + 9} \\ &= \int_{-\infty}^0 \frac{dx}{(x+2)^2 + 5} + \int_0^{+\infty} \frac{dx}{(x+2)^2 + 5} \\ &= \frac{1}{\sqrt{5}} \arctan \frac{x+2}{\sqrt{5}} \Big|_{-\infty}^0 + \frac{1}{\sqrt{5}} \arctan \frac{x+2}{\sqrt{5}} \Big|_0^{+\infty} \\ &= \frac{\pi}{\sqrt{5}}. \end{aligned}$$

$$(2) \int_1^2 \frac{dx}{x\sqrt{3x^2 - 2x - 1}}$$

解 $\because \lim_{x \rightarrow 1} f(x) = \lim_{x \rightarrow 1} \frac{1}{x\sqrt{3x^2 - 2x - 1}} = \infty,$

$\therefore x = 1$ 为 $f(x)$ 的瑕点.

$$\begin{aligned} \int_1^2 \frac{dx}{x\sqrt{3x^2 - 2x - 1}} &= \left[-\int_1^2 \frac{d\left(1 + \frac{1}{x}\right)}{\sqrt{2^2 - \left(1 + \frac{1}{x}\right)^2}} \right] \\ &= -\arcsin \frac{1 + \frac{1}{x}}{2} \Big|_1^2 = \frac{\pi}{2} - \arcsin \frac{3}{4}. \end{aligned}$$
